Hello Mr. Eldred,

After a lot of hours, I have completed the ammendment of the claims.
Sorry for the delay and for any inconvenience this may create.

Within the contents you will find corrections to several of the previously presented claims, as well as some new claims that will make the disclosed invention more grounded and more representative of a practical and functional buildable assembly as opposed to a more theoretical approach since it discloses more details about the issues to be considered for developing a device like such.

For example, the fact that a microcontroller based assembly functions making extensive use of presets, and runs activities as a consequence of detected events that trigger them generating responses which by the same token, are also conditioned by presets, etc.

Also, presets are customizable/programmable, and accessible via control means provisions and basic general provisions are made subservient to the needs for successfully carry on with the intended purposes.

I am sending the contents via fax as opposed to e-mail since I had second thoughts in consideration that the terms repeated throughout may create an ulterior problem due to the possibility of security scrutiny of electronic mail.

Mr. Eldred, I want to thank you in advance for your kind attention to this matter. I am a little worried due to the deadline approaching relatively soon and the fact that it probably will take me more time than to others in the trade to get things corrected if needed.

Please kindly let me know via e-mail when is a good moment to reach you in order to discuss any pertaining details.

Sincerely,

Eduardo C. Vasquez
